

HOUSEHUNT PROJECT REPORT

Abstract

HouseHunt is a web-based application designed to simplify the process of buying, selling, and renting properties. The system provides users with an easy-to-use interface to search properties based on location, price, and property type. The project aims to provide a digital solution for real estate management with secure authentication and efficient data handling.

1. Introduction

The real estate market has rapidly shifted towards digital platforms. HouseHunt offers a centralized platform for property listings, helping buyers and sellers connect efficiently. It reduces manual efforts and increases transparency in property transactions.

2. Objectives

- To develop a user-friendly property listing platform.
- To allow users to search properties using filters.
- To provide secure login and registration system.
- To manage property data efficiently using database.
- To ensure responsive and accessible web design.

3. System Architecture

The HouseHunt system follows a client-server architecture. The frontend is developed using HTML, CSS, and JavaScript, while the backend is built using server-side technologies with database support for storing user and property information.

4. Modules

- User Registration & Login Module
- Property Listing Module
- Search & Filter Module

- Admin Management Module
- Database Management Module

5. Conclusion

HouseHunt provides an efficient and user-friendly digital platform for property transactions. It simplifies searching, listing, and managing properties while ensuring security and scalability. The system can be further enhanced with advanced features like AI-based recommendations and mobile application integration.
